Class 7 Social Science – Chapter 2

Understanding the Weather

NCERT | Exploring Society: India and Beyond | Simple English Question–Answers

इस अध्याय की PDF के आधार पर सभी मुख्य विषयों के सरल अंग्रेजी में प्रश्न-उत्तर, पाठ के अंत में दिए गए चारों अभ्यासों के उत्तर, चित्रों एवं तालिकाओं पर आधारित प्रश्न, और परीक्षा के लिए अतिरिक्त महत्वपूर्ण प्रश्न-उत्तर नीचे दिए गए हैं।

Part A: Important topics of the chapter

1. Weather and its elements
2. Traditional methods of weather prediction
3. Weather instruments
4. Temperature and its measurement
5. Precipitation and rain gauge
6. Atmospheric pressure and barometer
7. Wind, wind vane and anemometer
8. Humidity and hygrometer
9. Weather stations and automated weather stations
10. Weather forecasting and weather warnings

Topic 1: Weather and its Elements

Q1. What is weather?

Answer: Weather is the condition of the Earth's atmosphere at a particular place and time.

Q2. What is the atmosphere?

Answer: The atmosphere is the layer of gases surrounding the Earth. We commonly call these gases air.

Q3. What is the troposphere?

Answer: The troposphere is the layer of the atmosphere closest to the Earth's surface. Almost all weather phenomena take place in this layer.

Q4. How high does the troposphere extend?

Answer: It extends about 6 to 18 kilometres above the ground. It is thinner at the poles and thicker in the tropical regions.

Q5. What are the five main elements of weather?

Answer: The five main elements are:

1. Temperature
2. Precipitation
3. Atmospheric pressure
4. Wind
5. Humidity

Q6. What is temperature?

Answer: Temperature tells us how hot or cold the atmosphere is.

Q7. What is precipitation?

Answer: Precipitation is any form of water that falls from the sky, such as rain, snow, sleet or hail.

Q8. What is atmospheric pressure?

Answer: Atmospheric pressure is the pressure caused by the weight of the air above and around us.

Q9. What is wind?

Answer: Wind is the movement of air from an area of high pressure to an area of low pressure.

Q10. What is humidity?

Answer: Humidity is the amount of water vapour present in the air.

Q11. Why do we need a common method to measure weather?

Answer: People experience hot and cold weather differently. Common measurements help everyone understand and compare weather conditions accurately.

Q12. How does weather affect our daily lives?

Answer: Weather affects our clothes, travel, farming, outdoor activities and daily plans.

Topic 2: Traditional Methods of Weather Prediction

OPEN=
DROOG WEER

Q1. What is weather forecasting?

Answer: Weather forecasting means predicting the weather in advance.

Q2. How did people predict the weather in ancient times?

Answer: People observed nature and the behaviour of animals and plants to predict changes in the weather.

Q3. Name some natural signs used to predict weather.

Answer: Ants carrying eggs to higher ground, frogs croaking loudly, birds flying low, squirrels gathering nuts and changes in pine cones are some natural signs.

Q4. What may ants moving their eggs to higher ground indicate?

Answer: It may indicate that heavy rain is expected.

Q5. How can pine cones respond to humidity?

Answer: Pine cones close in humid conditions and open in dry conditions.

Q6. What is meteorology?

Answer: Meteorology is the systematic study of weather and how it changes.

Q7. Who are meteorologists?

Answer: Meteorologists are scientists who study the weather and make weather forecasts.

Q8. Are traditional methods of weather prediction still used?

Answer: Yes. People in many parts of India still use traditional signs, especially to predict the arrival of the monsoon.

Q9. Why are scientific methods better for accurate weather prediction?

Answer: Scientific methods use instruments, measurements and weather data to make predictions more accurately.

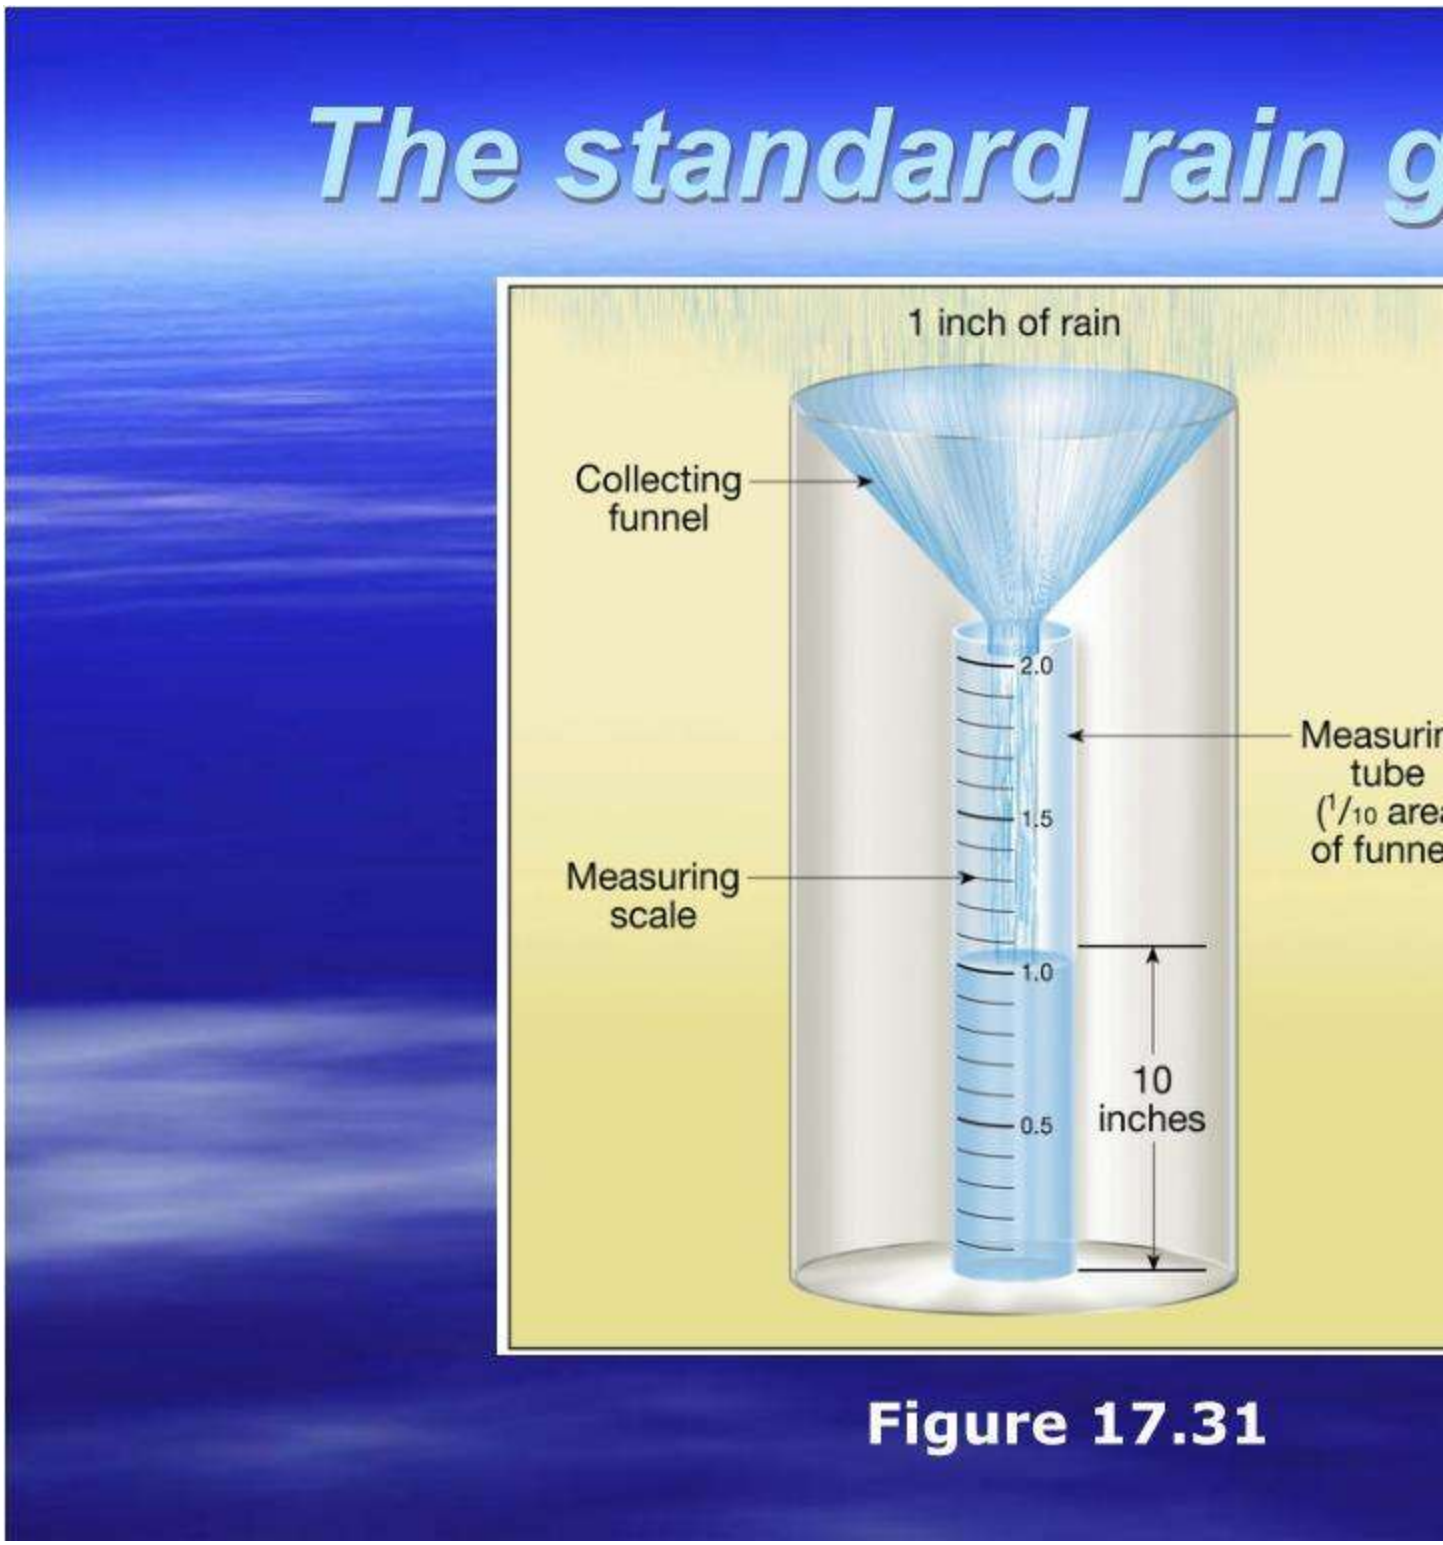

Topic 3: Weather Instruments

Weather instruments help us measure the elements of weather accurately.

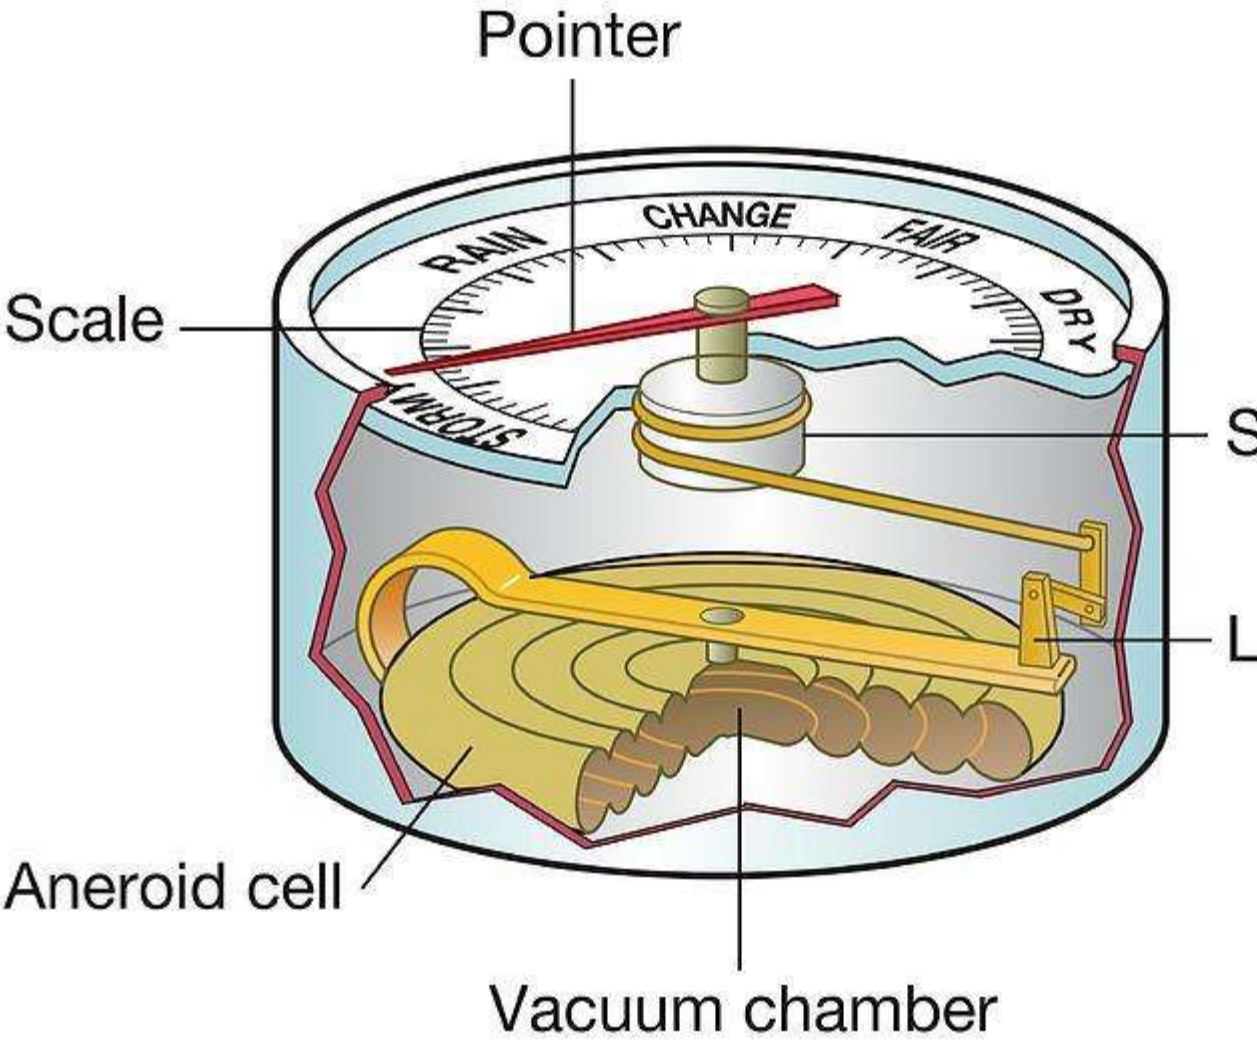

1. Thermometer

Measures temperature in degrees Celsius (°C) or Fahrenheit (°F).

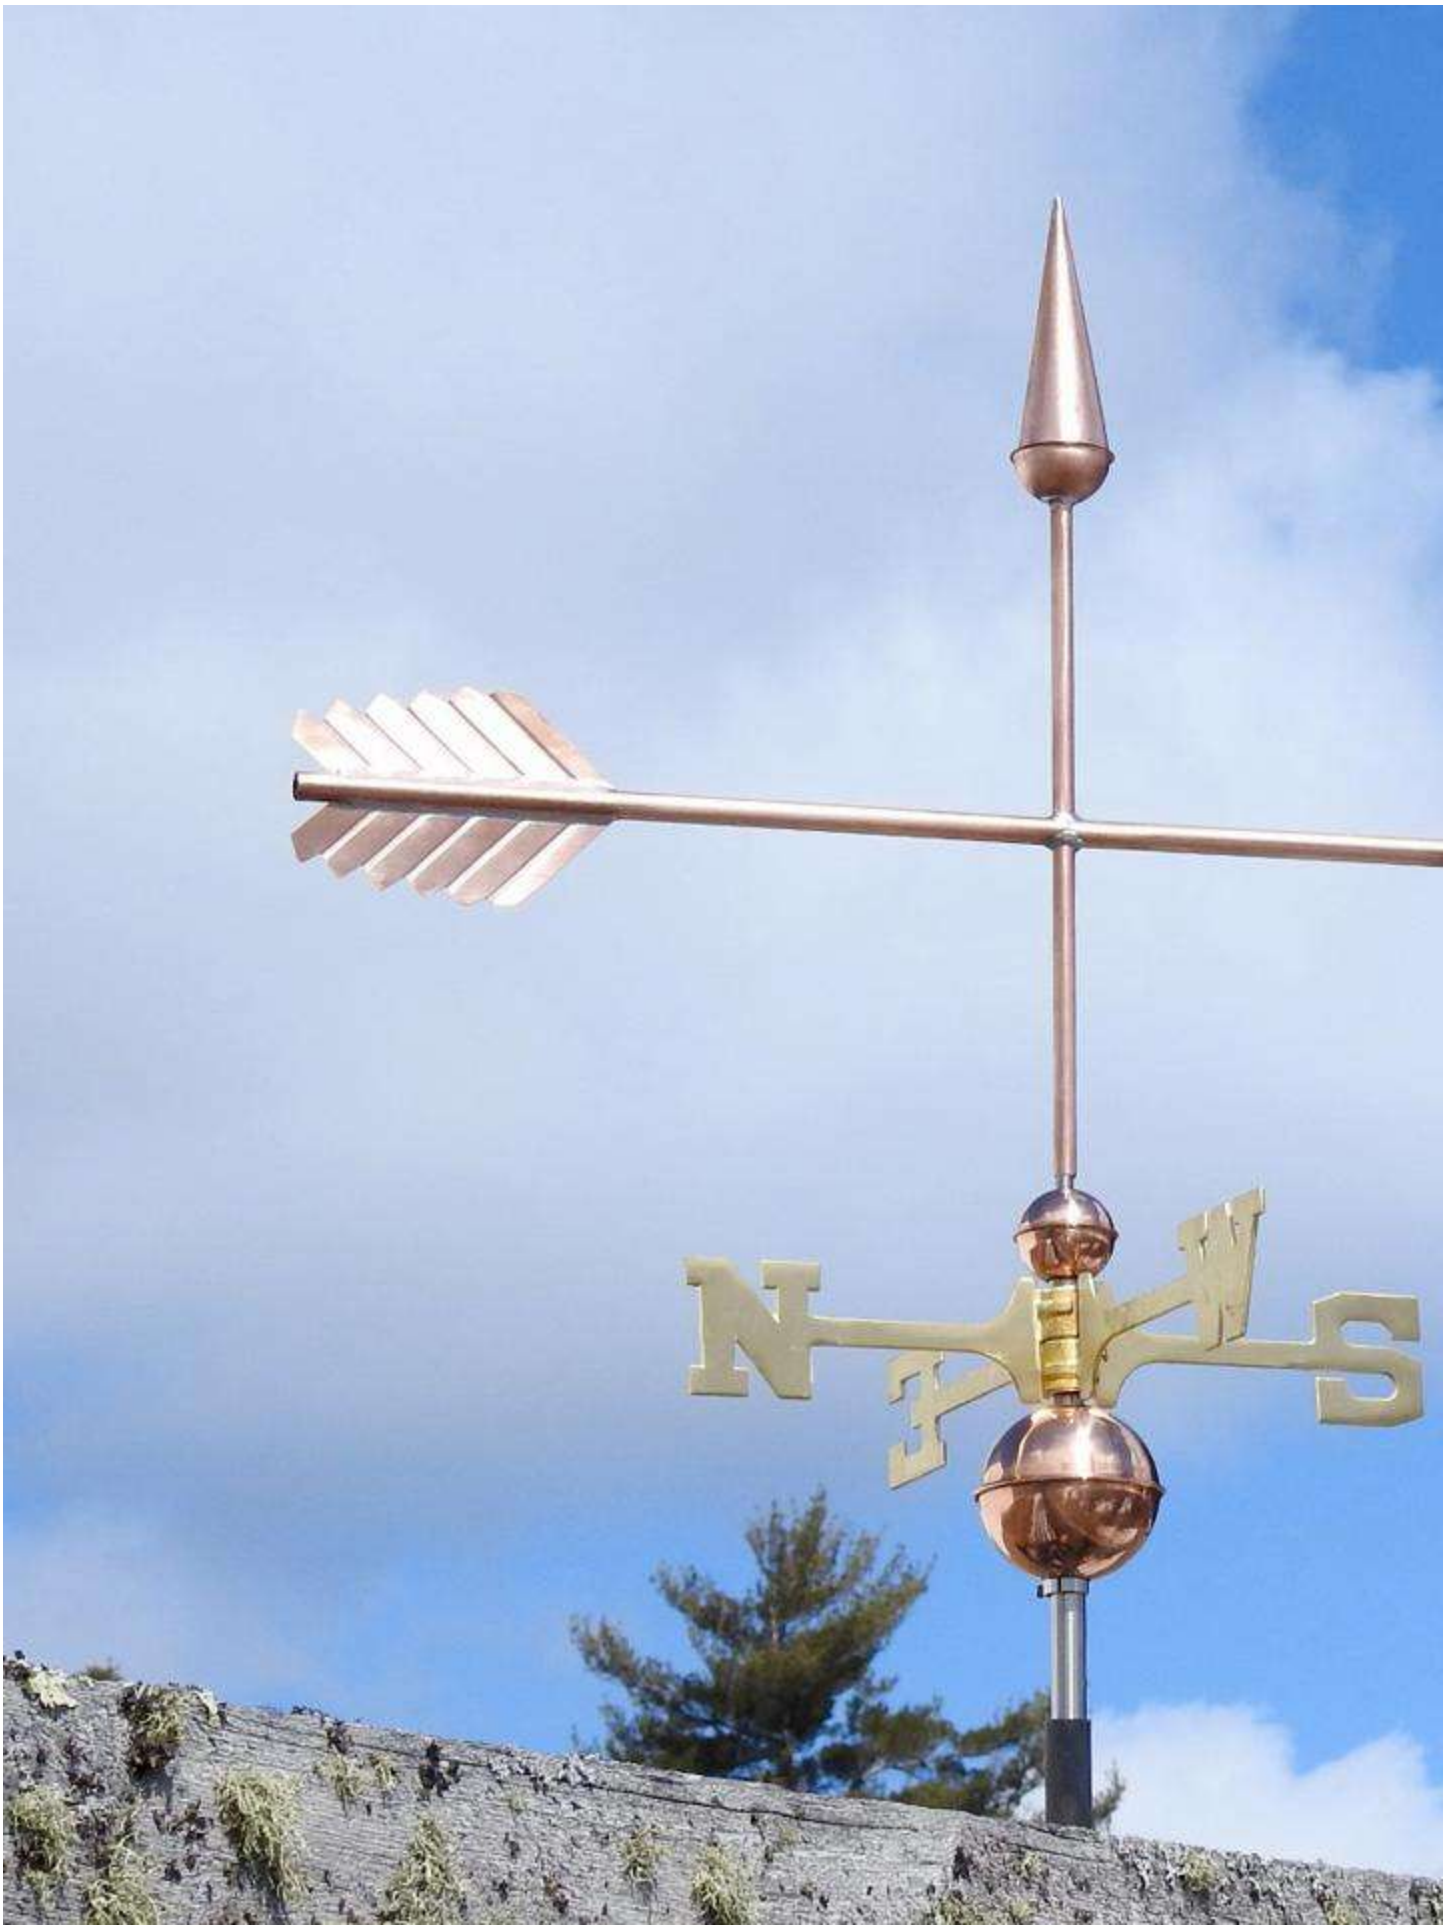

2. Rain gauge

Measures the amount of rainfall, commonly in millimetres.

Pointer
Scale
RAIN
CHANGE
FAIR
DRY
STORM
Aneroid cell
Vacuum chamber

3. Barometer

Measures atmospheric pressure, commonly in millibars (mb).

N
S

4. Wind vane

Shows the direction from which the wind blows.

5. Anemometer

Measures wind speed.

56.5
24.8
Hygrometer testo 608-H1
MODE

6. Hygrometer

Measures humidity in the air.

Q1. Why are weather instruments important?

Answer: They provide accurate measurements of weather conditions. These measurements help scientists monitor and predict the weather.

Q2. Which instrument measures temperature?

Answer: A thermometer.

Q3. Which instrument measures rainfall?

Answer: A rain gauge.

Q4. Which instrument measures atmospheric pressure?

Answer: A barometer.

Q5. Which instrument measures wind speed?

Answer: An anemometer.

Q6. Which instrument measures humidity?

Answer: A hygrometer.

Q7. Which instrument shows wind direction?

Answer: A wind vane, also called a weather vane.

Q8. What is a wind sock?

Answer: A wind sock is a fabric tube that indicates wind direction and gives a general idea of wind strength. It is used at airports to help pilots.

Topic 4: Temperature and its Measurement

Q1. How is temperature measured?

Answer: Temperature is measured with a thermometer.

Q2. Name the two temperature scales mentioned in the chapter.

Answer: The Celsius scale and the Fahrenheit scale.

Q3. What is the symbol for degrees Celsius?

Answer: °C.

Q4. What is the symbol for degrees Fahrenheit?

Answer: °F.

Q5. What is the equivalent of 15°C in Fahrenheit?

Answer: 15°C is equal to 59°F.

Q6. What is ambient temperature?

Answer: Ambient temperature is the temperature of the immediate surroundings.

Q7. What is the difference between maximum and minimum temperature?

Answer: Maximum temperature is the highest temperature recorded during a period. Minimum temperature is the lowest temperature recorded during that period.

Q8. What is the range of temperature?

Answer: The range of temperature is the maximum temperature minus the minimum temperature.

Formula:

$$ \text{Temperature Range}=\text{Maximum Temperature}-\text{Minimum Temperature} $$

Example: If the maximum temperature is 32°C and the minimum temperature is 18°C:

$$ 32-18=14^\circ C $$

The temperature range is 14°C.

Q9. What is the mean daily temperature?

Answer: It is the average of the maximum and minimum temperatures of a day.

Formula:

$$ \text{Mean Daily Temperature}= \frac{\text{Maximum}+\text{Minimum}}{2} $$

Example: If the maximum temperature is 30°C and the minimum is 20°C:

\[\frac{30+20}{2}=25^\circ C \]

The mean daily temperature is 25°C.

Q10. Why are digital thermometers increasingly preferred?

Answer: Digital thermometers are often more precise and can record more data.

Q11. What is the India Meteorological Department (IMD)?

Answer: The India Meteorological Department is the organisation responsible for meteorological observations and weather forecasting in India. It was established in 1875.

Q12. What is the motto of the IMD mentioned in the chapter?

Answer: “Adityat jayate vrishti,” meaning “From the sun arises rain.”

Important data-based question: Temperature chart

The table on page 33 of the textbook gives the following temperatures for a city in Madhya Pradesh.

Date	Maximum	Minimum
28 February 2025	29°C	16°C
1 March 2025	30°C	15°C
2 March 2025	31°C	17°C
3 March 2025	32°C	18°C
4 March 2025	30°C	17°C
5 March 2025	28°C	14°C
6 March 2025	29°C	15°C

Q1. What was the highest maximum temperature?

Answer: 32°C on 3 March 2025.

Q2. What was the lowest minimum temperature?

Answer: 14°C on 5 March 2025.

Q3. What was the temperature range on 3 March?

Answer: \(32-18=14^\circ C\).

Q4. What was the temperature range on 5 March?

Answer: \(28-14=14^\circ C\).

Q5. What was the temperature range on 1 March?

Answer: \(30-15=15^\circ C\).

Q6. What was the mean daily temperature on 3 March?

Answer: \((32+18)/2=25^\circ C\).

Q7. Why are temperature records useful?

Answer: They help us compare weather conditions, identify patterns and make predictions.

Topic 5: Precipitation and Rain Gauge

Q1. What is precipitation?

Answer: Precipitation is water that falls from the sky in the form of rain, snow, sleet or hail.

Q2. What is a rain gauge?

Answer: A rain gauge is an instrument used to measure the amount of rainfall.

Q3. How does a rain gauge work?

Answer: Rain falls into a collecting funnel and passes into a measuring cylinder. A scale on the cylinder shows the depth of the collected rainwater.

Q4. What does 30 mm of rainfall in a day mean?

Answer: It means that the measured depth of rainfall collected for that period is 30 millimetres.

Q5. In which unit is rainfall measured in the chapter?

Answer: Rainfall is measured in millimetres (mm).

Q6. Why should a rain gauge be placed in an open area?

Answer: It should be placed in an open area so that buildings and trees do not block the rainfall.

Q7. Why must a rain gauge be placed on a flat, stable surface?

Answer: A flat, stable surface prevents it from tilting or falling over and helps produce reliable measurements.

Q8. How can we calculate average weekly rainfall?

Answer: Add the rainfall measurements for the week and divide the total by the number of days measured.

$$\text{Average Daily Rainfall}= \frac{\text{Total Rainfall}}{\text{Number of Days}}$$

Q9. Why is rainfall measurement important?

Answer: It helps farmers plan irrigation and helps authorities prepare for floods, droughts and other weather-related events.

Topic 6: Atmospheric Pressure and Barometer

Q1. What is atmospheric pressure?

Answer: Atmospheric pressure is the pressure exerted by the weight of the air above and around us.

Q2. Which instrument measures atmospheric pressure?

Answer: A barometer.

Q3. What is the common unit of atmospheric pressure mentioned in the chapter?

Answer: The millibar, abbreviated as mb.

Q4. What is the normal atmospheric pressure near sea level mentioned in the chapter?

Answer: It is about 1013 mb.

Q5. What does a pressure below 1000 mb indicate in the chapter?

Answer: It indicates a depression or low-pressure system.

Q6. How does atmospheric pressure change with altitude?

Answer: Atmospheric pressure generally decreases as altitude increases.

Q7. Why do people sometimes feel breathless at high altitudes?

Answer: The air is thinner and less oxygen is available in each breath. The body has to work harder to get enough oxygen.

Q8. What does it mean to acclimatise?

Answer: To acclimatise means to adjust to a new climate or environment.

Q9. Why should people pause while travelling to high-altitude places?

Answer: Pauses allow the body time to adjust to lower oxygen availability and atmospheric pressure.

Q10. Why is measuring atmospheric pressure important?

Answer: Changes in pressure help meteorologists identify low-pressure systems and predict possible storms or cyclones.

Q11. Who uses atmospheric pressure measurements?

Answer: Meteorologists, weather forecasters, pilots and people involved in aviation and other weather-sensitive activities use these measurements.

Q12. What happens to atmospheric pressure during a depression?

Answer: Atmospheric pressure drops significantly, and the system may develop into a storm or cyclone.

Topic 7: Wind, Wind Vane and Anemometer

Q1. How is wind formed?

Answer: Wind moves from areas of high atmospheric pressure to areas of low atmospheric pressure.

Q2. What are the two important features of wind?

Answer: Wind speed and wind direction.

Q3. What is a wind vane?

Answer: A wind vane is an instrument that shows the direction from which the wind blows.

Q4. How does a wind vane work?

Answer: Its tail is pushed by the wind, causing the pointer to indicate the direction from which the wind comes.

Q5. What is an anemometer?

Answer: An anemometer is an instrument used to measure wind speed.

Q6. How does a cup anemometer work?

Answer: Its cups rotate when the wind blows. Stronger winds make the cups rotate faster, and the instrument calculates the wind speed.

Q7. In which unit can wind speed be measured?

Answer: Wind speed can be measured in kilometres per hour (km/h).

Q8. What is a wind sock used for?

Answer: A wind sock indicates wind direction and gives a general idea of wind strength, especially at airports.

Q9. Why do pilots and sailors need wind information?

Answer: Wind direction and speed affect aircraft take-off and landing, as well as the movement of ships.

Q10. How can wind help farmers?

Answer: Farmers can observe wind direction to estimate where rain may come from.

Q11. How does wind affect soil?

Answer: Strong winds can increase evaporation and make soil dry faster.

Q12. Why is wind important for the spread of seeds?

Answer: Wind carries seeds away from parent plants and helps them spread to new places.

Topic 8: Humidity and Hygrometer

Q1. What is humidity?

Answer: Humidity is the amount of water vapour present in the air.

Q2. What is water vapour?

Answer: Water vapour is water in its gaseous form.

Q3. What is relative humidity?

Answer: Relative humidity tells us how much water vapour the air contains compared with the amount it can hold under the same conditions. It is expressed as a percentage.

Q4. What does 0% relative humidity mean in the chapter's explanation?

Answer: It represents air containing no water vapour. The chapter notes that this does not occur under natural conditions.

Q5. What does 100% relative humidity mean?

Answer: It means the air is saturated with water vapour.

Q6. What is the usual relative humidity range in dry weather, according to the chapter?

Answer: It is usually between 20% and 40%.

Q7. What is the usual relative humidity range in humid weather?

Answer: It is usually between 60% and 80%.

Q8. Which instrument measures humidity?

Answer: A hygrometer.

Q9. Why does water evaporate slowly on a humid day?

Answer: The air already contains a large amount of water vapour, so evaporation takes place more slowly.

Q10. Why do wet clothes dry slowly on humid days?

Answer: High humidity slows down the evaporation of water from wet clothes.

Q11. Why do people often sweat more in humid weather?

Answer: Sweat evaporates more slowly in humid air, so the body finds it harder to cool itself.

Q12. Why is humidity measurement important in museums?

Answer: Museums monitor humidity to protect their exhibits from damage caused by unsuitable moisture levels.

Q13. Why is humidity measurement important in food processing?

Answer: It helps maintain suitable conditions for processing and preserving food.

Application-based questions

Q14. Delhi has 52% humidity, while Kochi has 84% humidity. Where are wet clothes likely to dry faster?

Answer: Wet clothes are likely to dry faster in Delhi because its humidity is lower.

Q15. Assuming the temperature is the same, where are people likely to sweat more: Delhi or Kochi?

Answer: People are likely to sweat more in Kochi because its humidity is higher and sweat evaporates more slowly.

Q16. Which city is likely to have higher humidity: Kochi or Jaipur? Why?

Answer: Kochi is likely to have higher humidity because it is near the sea. However, actual humidity should be checked using measurements.

Topic 9: Weather Stations and Automated Weather Stations

Solar radiation sensor
Rain gauge
Wind direction sensor
Temp and humidity sensor
Wind speed sensor
Rain snow sensor
Solar panel
Waterproof box
Pole bracket

8

Q1. What is a weather station?

Answer: A weather station is a place where instruments are used together to measure and record weather conditions.

Q2. What measurements are taken at a weather station?

Answer: Measurements may include temperature, humidity, precipitation, atmospheric pressure, wind speed and wind direction.

Q3. Why are weather readings taken at regular intervals?

Answer: Regular readings help scientists monitor changes in weather and make accurate forecasts.

Q4. What is an Automated Weather Station (AWS)?

Answer: An Automated Weather Station is a self-operating system that uses sensors to measure and record weather data.

Q5. How is an AWS different from a weather station that requires manual readings?

Answer: An AWS can automatically collect and record weather information without requiring a person to take every reading.

Q6. Where are Automated Weather Stations useful?

Answer: They are useful in agriculture, aviation, navigation, environmental monitoring and disaster preparedness.

Q7. Why was an AWS installed at a glacial lake in Sikkim, according to the chapter?

Answer: It was installed to provide early information about upcoming weather conditions in a high-altitude area.

Q8. Which organisation set up the AWS at the glacial lake in Sikkim in 2023, as mentioned in the chapter?

Answer: The National Disaster Management Authority (NDMA).

Q9. How does a weather station help meteorologists?

Answer: It provides regular weather data that meteorologists analyse to identify patterns and predict future weather.

Topic 10: Predicting the Weather and Weather Warnings

Q1. What is weather forecasting?

Answer: Weather forecasting is the scientific prediction of future weather conditions.

Q2. How do meteorologists predict the weather?

Answer: They collect weather data using instruments, study the data over time and use scientific methods to predict future conditions.

Q3. Why are weather predictions important?

Answer: They help people prepare for heavy rain, storms, floods, droughts, cyclones, heat waves and cold waves.

Q4. How do weather forecasts help farmers?

Answer: Farmers can plan sowing, irrigation, harvesting and other agricultural activities according to expected weather.

Q5. How do weather forecasts help fishermen?

Answer: Fishermen can avoid going to sea when dangerous storms are expected.

Q6. How do weather forecasts help local governments?

Answer: They help local governments prepare emergency services, mobilise resources and arrange evacuations when necessary.

Q7. What is a heat wave?

Answer: A heat wave is a period of unusually high temperatures that can be dangerous to people, animals and crops.

Q8. What is a cold wave?

Answer: A cold wave is a period of unusually cold weather.

Q9. What is a cyclone?

Answer: A cyclone is a large rotating weather system associated with low atmospheric pressure and strong winds. It may bring heavy rain and dangerous sea conditions.

Q10. What is a drought?

Answer: A drought is a prolonged period of unusually low rainfall that causes water shortages.

Q11. What is a flood?

Answer: A flood occurs when water covers land that is normally dry.

Q12. What is a dust storm?

Answer: A dust storm is a strong wind that carries large amounts of dust and loose soil.

Q13. What does a weather watch mean in the warning map?

Answer: A watch means people should stay updated because a weather hazard may develop or affect the area.

Q14. What does a weather alert mean?

Answer: An alert means people should be prepared for the expected weather hazard.

Q15. What does a weather warning mean?

Answer: A warning means people should take action to protect themselves from the expected hazard.

Q16. Why are weather forecasts especially important today?

Answer: They help people prepare for extreme weather events such as floods, droughts and cyclones, which can cause serious damage.

Q17. What is the difference between weather and climate?

Answer: Weather describes atmospheric conditions at a particular place and time. Climate describes the usual pattern of weather in a region over a long period. The next chapter develops this topic further.

Part B: All Textbook Questions and Activities

Question 1. Match the instrument with the weather element it measures.

Instrument	Correct weather element
1. Hygrometer	(d) Humidity

2. Anemometer (c) Wind direction and speed*
3. Barometer (b) Atmospheric pressure
4. Thermometer (e) Temperature
5. Rain gauge (a) Precipitation

Note: The textbook matching exercise pairs the anemometer with option (c), which says “Wind direction and speed.” More precisely, an anemometer measures wind speed, while a wind vane measures wind direction.

Question 2. Jyotsna is packing clothes for a school trip to Mumbai in June. The forecast predicts 29°C and 84% humidity. What advice would you give her?

Answer: I would advise Jyotsna to pack light, loose and breathable cotton clothes because the weather will be warm and humid. She should carry an umbrella or raincoat because June is generally a rainy period in Mumbai. She should also carry a water bottle and comfortable footwear.

Question 3. Where should students set up a rain gauge?

The options given in the textbook are:

1. The school vegetable garden
2. The terrace of the school building
3. Open ground with an elevated platform
4. The compound wall of the school
5. The verandah of the school laboratory

Answer: Option 3, open ground with an elevated platform, is the best choice, provided the platform is stable and the rain gauge is not obstructed by trees, buildings or other objects.

Reasons:

- It receives rainfall directly.
- Nearby objects do not block the rain.
- A stable, level platform prevents the gauge from tilting or falling.
- It allows regular and more reliable rainfall measurements.

The gauge should be positioned so that the elevated platform does not itself interfere with the collection of rain.

Question 4. Write a short weather report using the IMD Jammu and Kashmir data dated 1 February 2024.

The table on page 43 provides maximum and minimum temperatures, rainfall, snowfall and relative humidity for several places.

Sample report in simple English:

Good evening. Here is the weather report for Jammu and Kashmir on 1 February 2024.

Srinagar recorded a maximum temperature of 6.5°C and a minimum temperature of 0.2°C. It received only a trace amount of rainfall during the reported period. Relative humidity was 89% in both morning and evening.

Qazigund recorded a maximum temperature of 3.2°C and a minimum temperature of –0.4°C. It received 11.8 mm of rainfall and 10 cm of snowfall in the reported period. Its relative humidity was 97% in the morning and 90% in the evening.

Pahalgam recorded a maximum temperature of 1.1°C and a minimum temperature of –4.1°C. It received 6.0 mm of rainfall and 8 cm of snowfall. Its relative humidity was 96% in both morning and evening.

Gulmarg recorded a maximum temperature of –2.6°C and a minimum temperature of –7.6°C. It received 8.2 mm of rainfall and 6.35 cm of snowfall in the reported period. Its relative humidity rose from 76% in the morning to 100% in the evening.

Overall, the data show cold conditions, with snowfall recorded at several stations. Gulmarg had the lowest maximum temperature and the lowest minimum temperature among the listed stations.

Thank you.

Note: The report uses the figures printed in the textbook table. The rainfall and snowfall figures refer to the specific reporting periods shown in the table.

Part C: More Important Exam Questions

1. Give reasons for the following.

Q1. Weather should be measured using standard units. Why?

Answer: People may feel the same temperature differently. Standard units make weather measurements clear, accurate and easy to compare.

Q2. Atmospheric pressure decreases at high altitudes. Why?

Answer: There is less air above us at high altitudes, so the weight of the air and atmospheric pressure are lower.

Q3. Weather forecasts help save lives. How?

Answer: They provide advance warnings about dangerous weather. People can move to safer places and authorities can prepare emergency services.

Q4. A rain gauge should not be placed under a tree. Why?

Answer: A tree may block some rainfall, resulting in incorrect measurements.

Q5. Humidity affects the drying of clothes. How?

Answer: High humidity slows down evaporation, so clothes take longer to dry.

Q6. Wind direction is important for pilots. Why?

Answer: Wind direction affects aircraft take-off, landing and flight conditions.

Q7. Weather stations take readings regularly. Why?

Answer: Regular readings help meteorologists monitor changes and identify weather patterns.

Q8. Weather forecasts help fishermen. Why?

Answer: They warn fishermen about storms and dangerous sea conditions so they can avoid going to sea when necessary.

2. Differentiate between the following.

Q1. Weather and climate

Weather	Climate
Describes atmospheric conditions at a particular time and place.	Describes usual weather patterns over a long period.
Can change within hours or days.	Changes over much longer periods.
Example: It is raining today.	Example: A region generally has hot summers.

Q2. Wind vane and anemometer

Wind vane	Anemometer
Shows wind direction.	Measures wind speed.
Its pointer responds to the wind.	Its cups rotate when the wind blows.

Q3. Thermometer and barometer

Thermometer	Barometer
Measures temperature.	Measures atmospheric pressure.
Temperature is measured in °C or °F.	Pressure is commonly expressed in mb in the chapter.

Q4. Rainfall and humidity

Rainfall	Humidity
Water falling from the sky as rain.	Water vapour present in the air.
Measured using a rain gauge.	Measured using a hygrometer.
Commonly measured in millimetres.	Relative humidity is expressed as a percentage.

Q5. Weather station and Automated Weather Station

Weather station	Automated Weather Station
Brings together instruments for measuring weather.	Uses sensors to measure and record weather automatically.
Readings may require human involvement.	Can operate without a person taking every reading.

3. Extra application-based questions

Q1. If the maximum temperature is 35°C and the minimum is 23°C, find the temperature range.

Answer: \(35-23=12^\circ C\).

Q2. The maximum temperature is 28°C and the minimum is 16°C. Find the mean daily temperature.

Answer: \((28+16)/2=22^\circ C\).

Q3. Why might a city near the sea have higher humidity than an inland city?

Answer: Water evaporates from the sea and adds water vapour to the air. This can make coastal areas more humid.

Q4. What should people do when a cyclone warning is issued?

Answer: They should follow official instructions, move to safer places if advised, stay away from the sea and keep emergency supplies ready.

Q5. How can weather forecasts help schools?

Answer: Schools can plan outdoor activities, take precautions during heat waves or storms and make arrangements to protect students.

Q6. Why should weather data be collected over long periods?

Answer: Long-term data help scientists identify patterns and make better weather predictions.

Q7. What may happen if the atmospheric pressure drops sharply?

Answer: It may indicate a low-pressure system that can develop into a storm or cyclone.

Q8. Why should we not depend only on traditional weather signs?

Answer: Natural signs may be uncertain. Scientific instruments and forecasts provide more systematic and accurate information.

Part D: Quick Revision Test

Try answering these questions without looking at the notes.

8 MCQs

Class 7 • Chapter 2

1. Which instrument measures atmospheric pressure?

Thermometer
Barometer
Hygrometer
Rain gauge

2. What is the amount of water vapour in the air called?

Precipitation
Temperature
Humidity
Wind

3. Which instrument measures wind speed?

Anemometer
Wind vane
Barometer
Thermometer

4. What is the temperature range if the maximum is 31°C and the minimum is 19°C?

10°C
12°C
19°C
50°C

5. Which instrument measures rainfall?

Hygrometer
Thermometer
Rain gauge
Barometer

6. What does 100% relative humidity mean?

There is no water vapour
The air is saturated with water vapour
It is always raining
The temperature is 100°C

7. What is meteorology?

The study of rocks
The study of plants
The study of weather
The study of oceans

8. Which instrument shows wind direction?

Rain gauge
Wind vane
Anemometer
Barometer
Check Answers

Answer all 8 questions to check your score.

Final study tip: For this chapter, give special attention to the five elements of weather, the six measuring instruments, the temperature calculations, the relative humidity examples, the

functions of weather stations and the four textbook exercise questions. These are the most useful areas to revise before an examination.
